

What is claimed is:

1 1. An electronic presentation system comprising:
2 communication means;
3 a first image and voice display means connected to said
4 communication means in which display control and communication
5 control through said communication means are controlled by remote
6 control means; and
7 a personal computer provided with a second image and voice
8 display means connected to said communication means and different
9 from said first image and voice display means placed in a position
10 different from the position placing said first image and voice
11 display means, and input means; wherein said remote control means
12 selects the display contents displayed on said second image and
13 voice display means to display said selected display contents
14 on said first image and voice display means at the same time.

1 2. The electronic presentation system according to claim
2 1, wherein said remote control means comprises a remote control
3 transmitter sending a sending signal of a code corresponding
4 to a depressed button and means for converting said sending signal
5 of said remote control transmitter to a communication signal
6 of said communication means and sending the communication signal;
7 wherein said personal computer comprises means for
8 converting said sending signal of said remote control transmitter
9 sent through said communication means to a signal equivalent
10 to the output signal of the input means provided in said personal
11 computer, means for selecting the previously created display
12 contents displayed on said second image and voice display means,

13 by said converted signal equivalent to the output signal of said
14 input means, and means for converting a display signal of said
15 selected display contents displayed on said second image and
16 voice display means to a communication signal of said
17 communication means at the same time and sending the
18 communication signal;

19 wherein said remote control means further comprises means
20 for sending the display signal of said second image and voice
21 display means sent through said communication means to said first
22 image and voice display means.

1 3. The electronic presentation system according to claim
2 2, wherein the selection of the previously created display
3 contents displayed on said second image and voice display means,
4 done by the signal equivalent to said converted output signal
5 of said input means is executed by basic software installed in
6 said personal computer and application software operated under
7 said basic software and used to previously create said display
8 contents.

1 4. The electronic presentation system according to claim
2 2, wherein said communication means is a wired communication
3 system.

4 5. The electronic presentation system according to claim
5 2, wherein said communication means is a wireless communication
6 system.
